

## # Meeting Agenda

Group: group77

Date: 30/9

Chair: Hampus

Participants: Alexey, Elin, Hampus, David, Martin

### ## Objectives (5 min)

- Change from IMAP to POP3 protocol?
- Go through whole application so everyone has the same picture of what it should do
- What functions do we want to add to the application and the model in the future?
- Go through things that we need to fix

### ## Reports (15 min) from previous meeting

Martin: optimised and redid the parse method in GmailProvider. Fixed correct parsing for email content.

Alexey: implemented reply feature.

Hampus: Implemented and debugged LocalDiscStorage.

Elin: Refactored code so that Storage is connected to ApplicationManager instead of AccountHandler, started working on a StartPage for the app

David: Worked with css to styles the GUI

### ## Discussion items (35 min)

- Change from IMAP to POP3 protocol?
- Go through whole application so everyone has the same picture of what it should do
- What functions do we want to add to the application and the model in the future?
- Go through things that we need to fix

### ## Outcomes and assignments (5 min)

Outcomes:

#### 1) **Change from IMAP to POP protocol?**

We have decided to change from IMAP to POP3 because it will make our application faster and we would be able to expand our model without being restricted by having to connect to the server all the time.

This would mean that we only get an inbox folder from the server, and have to create our own folders in the model.

## 2) What functions do we want to add to the application and the model in the future?

- create a move method in Folder class to be able to move emails between different folders
- create a delete method in Folder that deletes a folder.
- create an add method in Folder to be able to create new folders
- search/filter/sort emails
- maybe add flags to email if we have time

## 3) Go through things that we need to fix

- fix so that when we have sent an email in the app that the sent folder updates with that email
- 

### Assignments:

- **Everyone** reflects on how we could implement search/filter/sort functions in design model until next meeting
- **Martin:** Implement POP3 and fix parse method and all other methods that are affected, fix response to refresh button
- **Alexey:** Inform user when mail was successfully sent and also add activeAccount by default as sender when writing an email
- **David:** Add label with currently active account next to profile icon and move add account button into combobox. Fix hover effects on all buttons. Fix GUI scaling.
- **Elin:** fix Startpage, connect to MainController, and work on AddAccountView to give user response
- **Hampus:** Responsible for search/filter/sort function/class.

## Wrap up

Tuesday 5/10 kl 8
